

Operating instructions for Cabelcon Crimp Tools

Please be sure to use the right tools for your Cabelcon connectors. If you are using the wrong hex size, the crimping result will be insufficient. For the same reason, never re-crimp with a smaller hex size.

Operation

Open the crimp tool, insert the connector in the correct hex opening and slowly crimp the connector until the lever arm is fully closed.

Maintenance

Your Cabelcon crimp tool needs to be maintained in a good condition. To insure longer tool life, use a few drops of oil to lubricate the moveable parts of the tool when needed.

Compression adjustment

The star wheel must be adjusted to insure proper crimping. After extensive use, the jaws may not close as tight as they should. Remove the locking screw and adjust the star wheel clockwise until proper adjustment is obtained (1/2 to 1 turn). Replace the locking screw.
